Simple retentions would account for a diminished sugar excretion, and there are grounds for believing that in experiments of this kind the action of the kidneys is not infrequently affected. 2. Experiments (like the parabiosis procedure of Forsbach, the pregnant-dog experiment of Carlson and Drennan, and certain of the anastomosis experiments of Hedon), in which cross circulations between two normal animals, or interchange between fetuses and mother, existed, and in which pancreatectomy in one of the animals (or the mother) was not followed by glycosuria of the grade which would be expected were it not for the intermingling of blood elements, but in which fluctuations of the glycosuria were used as the only index of the diabetic condition. These experiments are a priori susceptible of two interpretations. An internal secretion passes from the healthy into the diabetic animal, there to provide for the utilization of sugar,...
